The real highlight of the annual Covered Bridge Festival in Mansfield, Indiana, is not a bridge at all. It's Potty Palooza. "People walk half a mile away," says John Baker, a festival organizer. No wonder: the 27 Charmin rooms traveling bathroom structure, sky painted blue with white clouds and clinging to the bed of an 18-wheeled, inspires amazement everywhere go. "It's like a round at the state fair," Baker marvels. "They wait online 10 to 15 minutes sometimes!" Depending on the point of view, Potty Palooza represents both the epitome or the nadir of experiential marketing — a branded vehicle that touches consumers in places no advertising campaign would have gone. It is a showroom on wheels, a rolling free trial for . . . toilet paper. "The media is fragmenting, costs are increasing," says John Brase, Charmin brand manager at Procter & Gamble. "It's hard to reach consumers these days." Unless you have a large seeds and a trailer equipped with porcelain toilets, hardwood floors, and air conditioning — in addition to aromatherapy, skylights, change stations, a stand "Little Squirts" for children, and an LCD video screen in each room. Since its debut in 2002, the Potty Palooza truck has been on the road 11 months a year, visiting 26 to 30 events a year, visiting 26 to 30 events a year, visiting 26 to 30 events a year. Palooza caravan.) While guests wait, they participate in the full branding experience. Charmin dance while smiling brand representatives guide visitors to and from stalls and fir on rooms after each use. At the Covered Bridge Festival, which can mean cleaning after 5,000 guests per day. Says Alicia Haith, who runs the Palooza road team: "We cannot budge when that thing is full. We have to empty black water from 5 to 10 times a day." Gross. Is it worth it? Brase claims that the truck is part of one of the biggest consumer sampling programs everywhere. And while P&G won't talk ROI, he's getting something right. After Potty Palooza made his first appearance at the Covered Bridge Festival in 2002, 30,000 people signed a petition to continue returning. Your body can be a primary example of static friction. You wonder why you don't keep moving when you stopped walking? When you stopped walking? body is stopped in any way. The static friction acts between the feet and the floor, and this is what prevents you from backwards or moving, so static friction keeps you in place. Furniture on the floor Your furniture is heavy, so as you sit on the floor, you do not move with the lightest touch. The reason your furniture stays in place on the floor without sliding around for no reason is static friction. You can't move a piece of furniture simply sliding on the floor. Otherwise, anything on the floor in your home will move at the slightest touch or bump. A car stopped on a flat surface when you were driving and you stop your car, you have to apply friction to make the vehicle stop. But if you're on a flat surface and you're be a flat surface and you're be a flat surface and you're on a flat surface and you're be a flat s your car from moving. The static friction between your tires and the ground keeps the car in position and keeps it from rolling. If you take your foot off the brake or take your can try here an experiment that you can try to test the principle of static friction. Grab a book from your bookstore and bring it to a wall in your room. If you try to rest it against the wall without putting the weight on it, it will slide on the floor. You have to apply your strength to the wall to stay. The force that applies to the book puts the principle of static friction to work and allows the book to stay where it is. It is an example similar to a child scaling a door frame. He or she must apply the force of his or her weight to the door frame to challenge static friction that act on objects in different ways. Sliding friction is the type of friction that occurs when an object slides on a surface. An obvious example is when you lie on a slide of the playground. Another example of sliding clutch at work is writing along a surface. To go back to the example of a stopped car, if you take your foot off the brake and the car moves, the friction occurs when an object moves through a fluid. That fluid doesn't have to be liquid because gases also act with fluid friction. Examples of this type of friction a parachutist who slows down when the parachute opens and on swimmers feeling the resistance as they move their hands Water Your body can be a perfect example of static friction. You wonder why you don't keep moving when you've stopped walking? When you stop walking and stop, you're an example of static friction in action. The same principle applies when you are sitting on a surface or your body is stopped in some way. Static friction acts between your feet and the floor, preventing you from slipping backwards or moving out of control when you stop walking. It acts for you to start moving again, so static friction keeps you in your place. Furniture on the floor Furniture is heavy, so since it rests on the floor, you can't move a piece of furniture stays on the floor without slipping around for no reason is static friction. You can't move a piece of furniture without using your strength. Static friction is the force that keeps furniture from slipping on the floor. Otherwise, anything on the floor of your house will move with the slightest touch or bump. A car stops on a flat surface When you drive and stop your car, you need to apply friction to make the vehicle stop. But if you're on a flat surface and you can get your foot off the brake and the car doesn't move, you're witnessing static friction at work. On a flat surface and you can get your foot off the brake and the car doesn't move, you're witnessing static friction at work. On a flat surface when you can get your foot off the brake and the car doesn't move, you're witnessing static friction at work. what keeps your car from moving. Static friction between the tires and the ground keeps the car in position and keeps it rolling. If you take your foot off the brake or take your car out of the parking lot and roll, a different form of friction comes into play. A Static Friction Experiment You Can Try Here's an experiment you can try to test the principle of static friction. Take a book from your bookstore and put it on a wall in your room. If you try to lean it against the wall without weighing it down, it will slide on the floor. You have to apply your strength to the wall so it stays. The force applied to the book activates the principle of static friction and allows the book to stay where it is. It's an example similar to a child climbing on a door frame. He or she must apply the force of his or her weight to the door frame to activate static friction that act on objects in different ways. Sliding friction is the type of friction that occurs when an element slides on a surface. An obvious example a YA® when you are sliding on a playground slide. Another example of sliding friction at work is writing with a pen or pencil. Sliding friction allows the ink or lead to apply to the paper you're writing on. Rolling friction is exactly what its name suggests: the friction that occurs when a Rolls along a surface. To return to the example of a firm car, if youthe foot out of the brake and the car moves, the rolling friction is at work. That is why most types of land transport use wheels. Fluid friction occurs when an element moves through a fluid. This fluid should not be liquid because the gases also act with the friction of the fluid. Examples of this type of friction include a parachute that slows down when the parachute opens and swimmers who feel resistance while moving their hands in the water. 1 How much does a million dollars weigh? 2 Know your body (water!): The differences between a bay, a sound and a delta 3 These elements show the pumpkin trend went too far 4 How much money do you start with in the game of life? 5 What kind of oil does a Dodge Ram 1500 use? 1 How much does a million dollars weigh? 2 Know your body (water!): The differences between a bay, a sound and a delta 3 These elements show the pumpkin trend went too far 4 How much money do you start with in the game of life? 5 What kind of oil does a Dodge Ram 1500 use?
