

I'm not robot!

Calculator app with square root function. Does android have a calculator. Best calculus calculator app. Is there a scientific calculator app.

Photomath math solver is one of the best math solver app for solving math problems and algebra calculator. It uses augmented reality, which means that you can simply point your camera at any piece of paper with an equation or an arithmetic problem and it will find a solution. Photomath is probably the best app for solving mathematical problems. Photomath reads and solves mathematical problems instantly by using the camera of your mobile device. From basic arithmetic to advanced calculus, Photomath uses state-of-the-art technology to read math problems and provide step-by-step explanations on how to approach them. PhotoMath is the #1 math problem solver and algebra calculator to learn math amongst students, parents, and teachers, that will help you interpret problems with comprehensive math content from arithmetic to calculus to drive learning and understanding of fundamental math concepts. PhotoMath math solution app does a great job with basic arithmetic problems and algebraic equations. Photomath supported math content are Numbers, Fractions, Decimals, Powers and Roots, Complex Numbers, Algebraic expressions, Linear equations/inequations, Quadratic equations/inequations, Absolute equations/inequations, Trigonometric equations, Binomial Theorem, Calculus. What device is this app available on? Android, iPhone and iPad. Download PhotoMath Our math teachers used to warn us that we wouldn't have a calculator everywhere we go. But now we have smartphones with us everywhere we go, with access to hundreds of calculator apps. Since there are so many options, it can be hard to nail down the right one for your needs. Today, we're going to break down the best free calculator apps for Android. 1. Calculator (by Google) This is your simplest, safest bet. Google offers a bare bone, yet well-designed app that will handle basic math tasks, but not much else. It calculates in real time, so you don't even have to reach for the equals button. You can get some more complex functions by swiping in from the right side, but it's still a rather limited set. The only other major feature is that you can tap at the top of the screen to reveal a three-dot menu that allows you to change decimals to fractions—and that's about it. There's no history or graphing. It is totally free and has no ads, though, so it gets the job done (unless you're trying to live Google-free). Download: Calculator by Google (Free) 2. Calculator ++ If the Google Calculator is a little too basic for you, try Calculator ++. This app has both a Simple and an Engineer mode. It supports a wide variety of functions, a history of everything you've calculated, and it can even create graphs. One neat little feature is swipeable buttons. Swipe up on a button to activate the option on the top part, and swipe down to activate the option on the lower part. It's also customizable, with several theme options available. Along with a widget for your home screen, it includes a floating window mode. This app does contain ads, but they only display on side pages like History, not the main calculation page. You can remove them for \$4. Overall, it strikes a nice balance between simple and functional. Download: Calculator ++ (Free) 3. ClevCalc ClevCalc is actually a bunch of calculators all in one. Not only does it have the basics like a currency and unit converter, but it also has everything from a fuel cost calculator to an ovulation calculator. You can choose from several themes, all inspired by Material Design. Though the app does have ads, you can remove them via an in-app purchase. Download: ClevCalc (Free) 4. Calculator (by TricolorCat) Here's a choice simply named Calculator. This one is best for folks who are particular about their keyboard because it has three different layout styles: Standard, Stylish, and Ergonomic. It also features a ton of different color options and the option to add or remove the memory buttons. Other than that, you can change how decimals appear (1.5 or 1.5) and view your history by swiping down from the top. It's super simple, but also more customizable than most basic calculator apps. The app does have a banner ad along the bottom, but you can buy the Pro version to remove it. Download: Calculator (Free) Download: Calculator Pro (\$1.50) 5. CalcTastic Scientific Calculator This app is for anyone who needs more scientific calculation options. It has a basic calculator too, but the emphasis is on the scientific portion. You can work on complex problems to your heart's content, but it can't graph anything. It's also nicely customizable, with some classic scientific calculator themes and a plain light theme. If you upgrade to the Pro version for \$1, you get seven more themes, polar form complex numbers, landscape support, and a programmer calculator. Download: Scientific Calculator (Free) Download: Scientific Calculator Pro (\$1) 6. RealCalc Scientific Calculator Another good scientific calculator is the popular RealCalc. It's designed to look like the traditional hand-held scientific calculators you used in school. RealCalc has all the standard scientific function you'll need. It also supports history, memories, unit conversions, and constants. Binary, octal, and hexadecimal calculations work just fine too. The app offers two calculator types, traditional and Reverse Polish Notation (RPN). When using the traditional type, make sure you put parentheses around parts of the equation to preserve calculation order. It's different from the other calculators listed above—you can't just type in the equation as it appears. You can also choose from a number of display styles and formats to customize the look of the app. The free version offers many useful features that may be enough for your purposes. If you want more features, like fractions, degrees/minutes/seconds, customizable conversions and constants, landscape mode, and a 12-digit display, you can purchase RealCalc Plus. Download: RealCalc (Free) Download: RealCalc Plus (\$3.49) 7. CALCU This app finally brings a somewhat original name (even if it is just a shortened version of "calculator"). CALCU has both basic and scientific layouts, a bunch of slick themes, and even an option for adjusting the font. It has swift little swiping animations, like swiping down to reveal the history or swiping up to reveal more scientific buttons. There's a banner ad along the top that you can remove via a \$2 in-app purchase. Download: CALCU (Free) 8. All-In-One Calculator If you simply want a calculator, pure and simple, you may be better served by one of the other apps on this list. But if you want an app that not only offers a smooth and cleanly designed calculator, but also so many other things, this one is for you. This app can calculate numbers, but also percentage, equations, shapes, speed, temperature, currency, age, and so much more. Chances are, anything that you need calculated can be computed with this app. Download: All-In-One Calculator (Free, in-app purchases available) 9. Desmos Graphing Calculator For those who want a dedicated graphing calculator app, Desmos Graphing Calculator is for you. There's not even a basic calculator interface here; it's all about the graphs. The app makes it easy to program in and plot multiple functions, then use sliders to adjust them. You can even start with some of the app's example graphs for some help. If you want, you can make an account to sign in and sync your graphs. Best of all, there are no ads and no in-app purchases. Download: Desmos Graphing Calculator (Free) Which Is the Best Calculator for Android? Each of these apps has its strengths and weaknesses, so it's worth trying out a few before settling on which works the best for you. They're all free, so you've got nothing to lose. Plus, by using these free calculator apps, you'll see the benefit of replacing the stock Android apps. You don't need to use what your phone manufacturer has lumped upon you. Everybody needs a calculator. Because of this, there have been many calculators through the years, and they're actually pretty easy to find. Most people use them to figure out stuff like how much to tip at restaurants, and students literally must have them for school. Believe it or not, Android can solve all of your needs in this instance. Here are the best calculator apps for Android. The best calculator apps for Android Price: Free / Up to \$1.49 Calc is a calculator app from the developers of, oddly enough, Today Weather. The developers did the weather app right, and they also nailed the calculator app space as well. This is a simple, functional calculator app with a fairly typical UI. Some of the features include the ability to re-use old answers in your next calculation, a calculator history, and themes. It's great for simple use, although some users complain about the advertising strategy and a few bugs here and there. We don't recommend using this for your collegiate-level trigonometry class, but it should do fine to help divide up a lunch check. Joe Hindy / Android AuthorityCalcu is one of the most popular calculator apps for Android. It features all of the basics. Some other features include a calculation history, memory keys, various customization features, themes, and gesture controls. It's not a full scientific calculator, but it does have enough functions to go beyond what you normally find in basic calculators. The free version of the app contains advertising. You can remove ads for a single \$1.99 purchase. Otherwise, the two versions are basically the same. It's a good competitor for the stock calculator app that comes on most devices. ClevCalc is kind of an all-in-one solution for calculator apps. It has a general use calculator with your usual operators. It also contains simple trigonometric and logarithmic functions. However, the thing that sets this calculator apart is all of the other stuff it can do. Some of its additional functionality include currency conversion, unit conversion, a unit price calculator, and a variety of other tools. Another example is a discount calculator. You enter in the price and the percentage off, and the app will tell you its new retail price. We encourage you to check out the Play Store description for the full list because it is rather lengthy. Demos Graphing Calculator is a good mobile substitute for the more popular graphing calculators. It can do the basic stuff like most calculator apps. There is also a full assortment of scientific calculator options. It can also do graphs, tables, stats, and more. Graphs are interactive with tons of data to share. Additionally, tables and stats are customizable. It'll work well for most types of academia. It's completely free with no in-app purchases. Digitalchemy is a developer on Google Play. They have three total calculator apps. The first is Calculator Plus. It's a basic calculator that does everything you'd expect a calculator app to do. The second is Fraction Calculator. Its main focus is fractions. It lets you make calculations using them without breaking them down into decimal format. This is excellent for early mathematics, especially for kids. The final one is Artful Calculator. It's essentially just Calculator Plus but with more artsy themes. You can go with any one of them, but we listed it here for its fractions calculator because you don't see a good one of those every day. Financial Calculators is a series of calculators to help you make sense of your finances. It features dozens of modes that can help you quickly and easily calculate anything from 401k contributions to student loan repayment, home loan interest, and even how many taxes you owe out of each paycheck. There have been a few bugs reported with a few of the modes, but the vast majority of them work perfectly. Anybody who needs help with calculating their finances should check this out. It's completely free with no in-app purchases. It does have ads, though. HiEdu Scientific Calculator is a surprisingly good scientific calculator. It does all of the basics correctly as it should. It also works with more advanced stuff like logarithms and other such things. The UI is clean and simple, and the app includes over 1,000 math formulas. You can do basically whatever you need short of graphing, and there are other calculators for that. That may upset some people, but it's still factually accurate. The pro version runs for \$1.49. HiPER Scientific Calculator is one of the better calculator apps, especially for educational use. It has most of the basic scientific calculator functions, a built-in unit converter with over 200 units, and even some obscure features like a random number generator, permutations, etc. Most of the features are available in the free version, with the pro version offering up to 100 decimal places and nine digits of exponents. This one also supports theming. The pro version runs for \$2.99, but the free version works too. MyScript Calculator 2 is one of the more entertaining calculator apps for Android. It lets you write out your equation. The app uses OCR to translate it into text format and then helps you solve the problem. It's easy to use, fun for kids and adults, and there's a certain satisfaction with writing out the equation yourself. The app supports basic operations, powers, roots, exponentials, some trigonometry, logarithms, constants, and more. Thus, it's usually good enough through high school and up through the collegiate levels for most people. However, those dabbling in super complicated math will max this app out fairly quickly. Here's the thing, folks. Unless you're a student, a mathematician, or an accountant, you probably don't need a super complicated calculator app. A lot of people only need these things for determining how much to tip at a restaurant or counting down their cash drawers at the end of the night at work. For that, the calculator your phone already has is perfectly capable of doing the job. We really only recommend the other nine apps on this list if your built-in calculator is really bad. Don't feel the need to download a third-party app just for the sake of it. For those interested, Google Calculator is linked at the button below if you want the most basic calculator that just works.
